To Whom It May Concern:

Southern Tennessee Medical Center has been using Blue Oak Projects for over a year as the general contractor for projects of varying complexity. The most complex of these projects involved renovation of a physician suite for an Advanced Wound Center which included the installation of a bulk oxygen supply system to feed two hyperbaric chambers. Brant McGill of Blue Oak worked with the project architect, mechanical engineers, oxygen vendors, subcontractors and hospital representatives to complete the project on schedule. Inspections by the Tennessee Department of Health to determine if the project met regulatory standards for life safety were passed without difficulty. Currently Blue Oak is in the process of renovating the Childbirth Center, a project requiring staging to accommodate a patient care area that is in use.

Brant is present in the facility daily to determine the progress of each project. He is available to meet with key participants in the projects on a regular and frequent basis. His employees and the subcontractors that he brings to the project provide quality work and are professional in their interaction with the involved hospital staff. They are always respectful of patient care and the confidential nature of our work as they work in our patient care areas.

I have every confidence in the work of Blue Oak Projects and highly recommend them as a quality partner for general contracting services.

Sincerely

Roxana J. Pool RN, MPH
Chief Operating Officer
